Types of AMS interventions: stopping therapy

Trade one broad-spectrum regimen for another

Narrow the spectrum based on culture and susceptibility results

Patients doing well; change to po and/or discharge

Patient cured; discontinue therapy

Resistance effect	Cost effectiveness
Little effect	Little effect
Large effect	Large effect
Large effect	Enormous effect
Large effect	Large effect

Journal of Antimicrobial Chemotherapy

Are infection specialists recommending short antibiotic treatment durations? An ESCMID international cross-sectional survey

Gabriel Macheda[1], Oliver J. Dyar[2], Amandine Luc[3], Bojana Beovic[4,5], Guillaume Béraud[6–8], Bernard Castan[9], Rémy Gauzit[10], Philippe Lesprit[11], Pierre Tattevin[12], Nathalie Thilly[3,13] and Céline Pulcini[1,13]* on behalf of ESGAP and SPILF

Conclusions:

The majority of infection specialists currently *do not advise the shortest possible duration* of antibiotic therapy to prescribers.

Promoting short durations among these experts is urgently needed.

Table 5. Prevalence of short durations of antibiotic therapy and shortened durations by country

	N	Percentage short treatment[a]	Percentage shortened duration[b]
Argentina	29	10.7	42.3
Austria	37	20.8	84.2
France	165	46.0	50.4
Germany	79	63.6	60.7
Greece	13	0	54.6
Ireland	16	0	46.7
Israel	26	17.4	38.1
Italy	23	6.7	38.5
Netherlands	13	38.5	33.3
Slovenia	39	12.5	51.9
South Africa	16	73.3	35.7
Spain	82	44.4	46.0
Sweden	22	10.0	33.3
Turkey	18	13.3	55.6
UK	136	40.2	32.1
Uruguay	17	18.8	53.3

[a]Percentage of respondents advising short duration of therapy in more than 50% of the vignettes.

Antibiotics :
The Double-Edged Sword of Modern Medicine

Fundamental problems of AMS

START ANTIBIOTICS

- ✓ The easiest thing to do in medicine is to

STOP ANTIBIOTICS

- ✓ The **hardest thing to do!**
- ✓ The most common question is

"How many more days of antibiotics?"

- ✓ Not enough doctors ask

"Does this patient need antibiotics?"

Fundamental barriers to AMS compliance

START ANTIBIOTICS

- ✓ Limitation in Decision-making autonomy

STOP ANTIBIOTICS

- ✓ **Limitations of international&local evidence–based policies**
- ✓ Lack of Diagnostic tools & biomarkers
- ✓ Culture behavior/ team work/ hierarchy

I would definitely push my case
My patient is more critical

E. Charani et al. CID 2013:57 (15 July) & Differences in Antibiotic Decision-making; CID 2019:69 (1 July)

Recommended durations: *Shorter is better*

Evidence from RCTs and observational studies

BSI: antibiotic treatment duration

Type of infection	Duration	Evidence from RCTs, systematic meta-analysis and observational studies

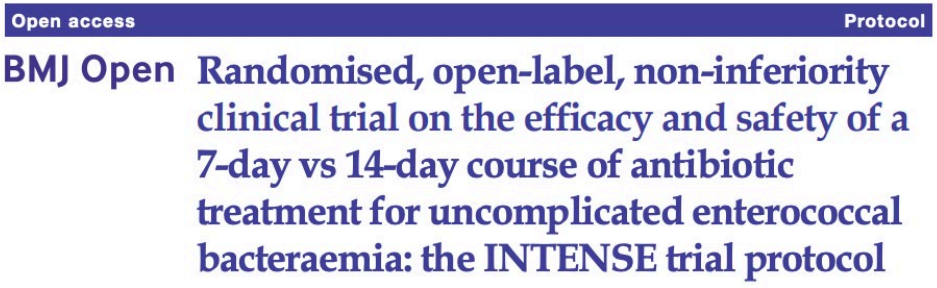
Narrative review

How do I manage a patient with enterococcal bacteraemia?

Elena Rosselli Del Turco [1,†], Michele Bartoletti [1,†], Anders Dahl [2], Carlos Cervera [3], Juan M. Pericàs [4,5,*]

[1] Infectious Diseases Unit, Department of Medical and Surgical Sciences, Sant'Orsola-Malpighi Hospital, University of Bologna, Bologna, Italy
[2] Department of Cardiology Herlev-Gentofte University Hospital, Copenhagen, Denmark
[3] Division of Infectious Diseases, University of Alberta, Edmonton, Canada
[4] Infectious Diseases Department, Hospital Clínic de Barcelona, Barcelona, Spain
[5] Vall d'Hebron Institute for Research (VHIR), Barcelona, Spain

- The length of therapy of non-complicated EB ranges from **7 to 14 days**.
- For **complicated EB** other than IE, the usual length of therapy is **4 weeks.**
- However, some cases may need longer courses For *E. faecalis IE*, the preferred options are ampicillin plus ceftriaxone (**6 weeks**) or ampicillin plus gentamicin (4 weeks in native valve IE and 6 weeks in prosthetic valve IE; a short regimen of 2 weeks of gentamicin might be used).



Open access Protocol

BMJ Open

Randomised, open-label, non-inferiority clinical trial on the efficacy and safety of a 7-day vs 14-day course of antibiotic treatment for uncomplicated enterococcal bacteraemia: the INTENSE trial protocol

Maldonado N, the INTENSE trial protocol. BMJ Open. 2023 Sep 6;13(9):e075699.

Exceptions for candidemia?

Questioning the 14-day dogma

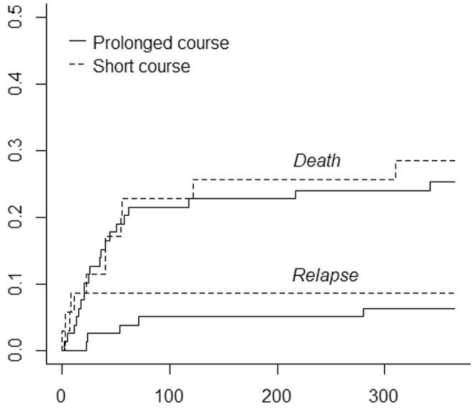
Potential advantage:

- Minimising patients' exposure to antifungal drugs reducing drug-resistant strains emerging.
- This approach becomes particularly pertinent in light of the increasing prevalence of *Candida glabrata*, *Candida parapsilosis* and multiresistant *Candida auris*

Table 3. Clinical Outcomes (90-Day and 1-Year All-Cause Mortality and Relapse) of Prolonged-Course Antifungal Therapy vs Short-Course Antifungal Therapy

	Univariable Analysis		Multivariable Analysis		IPTW-Adjusted HR	
Primary End Point	HR (95% CI)	*P* Value	HR (95% CI)	*P* Value	HR (95% CI)	*P* Value
All-cause 90-d mortality	1.00 (0.43–2.30)	.99	0.47 (0.14–1.55)[a]	.22	0.67 (0.31–1.47)	.32
Secondary end points						
1-y recurrent *Candida* BSI	0.70 (0.17–2.93)[b]	.63	1.33 (0.30–6.00)[b,c]	.71	1.07 (0.20–5.80)[b]	.94
All-cause 1-y mortality	0.97 (0.46–20.60)	.95	0.58 (0.20–1.67)[d]	.32	0.72 (0.35–1.50)	.38

SC (5–11 days) or PC (12–24 days)



Limitations to treatment shortening strategies:

- deep organ candidiasis, chronic disseminated candidiasis or metastatic infection sites.
- Neutropenic patients: neutrophil function is crucial in eliminating Candida spp.
- suppurative thrombophlebitis, pacemakers, intraventricular devices and endovascular prostheses.
- Uncertain duration of ongoing candidemia or candidemia origin

In this decision-making process, the indispensable role of **infectious disease physicians**, is evident.

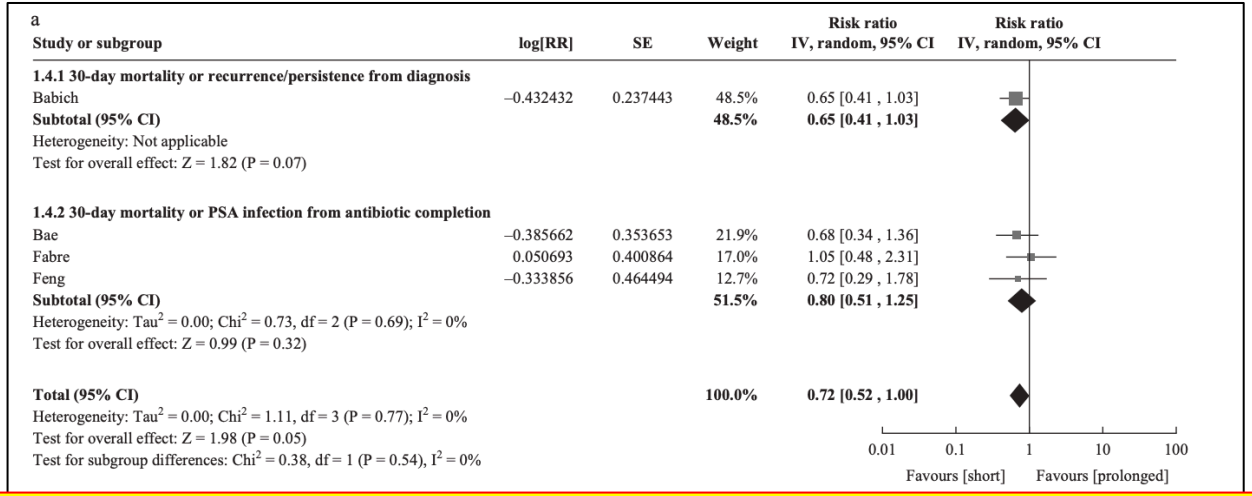
For patients hemodynamically stable and afebrile at 48 h prior to discontinuation, ***7 days of antibiotic therapy for enterobacterales bacteremia*** result in similar outcomes as 14 days, in terms of mortality, relapse, LOS, complications of infection, resistance emergence, and AEs.

Adi Turjeman; eClinicalMedicine 2023;55: 101750

Short versus prolonged duration of therapy for Pseudomonas aeruginosa BSI: *a systematic review and meta-analysis*

Variables	Babich et al., 2022 [23]		Bae et al., 2021 [24]		Fabre et al., 2019 [27]		Feng et al., 2023 [28]	
	Short (*N* = 274)	Prolonged (*N* = 384)	Short (*N* = 97)	Prolonged (*N* = 193)	Short (*N* = 69)	Prolonged (*N* = 180)	Short (*N* = 229)	Prolonged (*N* = 205)
Age (years)	68 (58–79)	67 (54–76)	64 (53–73)	64 (55–72)	61 (48–76)	66 (52–76)	39 (24–51)	42 (27–52)
Male	171 (62.6)	251 (65.4)	64 (66.0)	123 (63.7)	43 (62.3)	112 (62.2)	128 (55.9)	109 (53.2)
Pitt bacteraemia score	NR	NR	2 (0–3)	2 (0–3)	2 (2–3)	2 (1–3)	NR	NR
ICU admission	40 (14.7)	65 (17)	6 (6.2)	23 (11.9)	21 (30.4)	54 (30.0)	NR	NR



Conclusions: short duration of antimicrobial therapy may have similar efficacy to prolonged treatment for PSA-BSI.
Future **randomized trials** will be necessary to definitively determine optimal management of PSA bacteraemia.

74 hospitals in seven countries, 3608 patients

Excluding criteria: severe immunosuppression, foci requiring prolonged treatment, single cultures with possible contaminants, or ***Staphylococcus aureus.***

- 55.0% of patients were in the ICU and 45.0% were on hospital wards.
- Infections were acquired in the community (75.4%), hospital wards (13.4%) and ICUs (11.2%).
- Bacteremia most commonly originated from the UT (42.2%), abdomen (18.8%), lung (13.0%), vascular catheters (6.3%), and SSTIs (5.2%).
- By 90 days, 261 patients (14.5%) receiving antibiotics for 7 days had died and 286 patients (16.1%) receiving antibiotics for 14 days died (difference, −1.6 percentage points [95.7% confidence interval {CI}, −4.0 to 0.8])

- These findings were generally consistent across secondary clinical outcomes and across prespecified subgroups defined according to patient, pathogen, and syndrome characteristics.

Exceptions for VAP ?

ORIGINAL

Comparison of 8 versus 15 days of antibiotic therapy for *Pseudomonas aeruginosa* ventilator-associated pneumonia in adults: a randomized, controlled, open-label trial

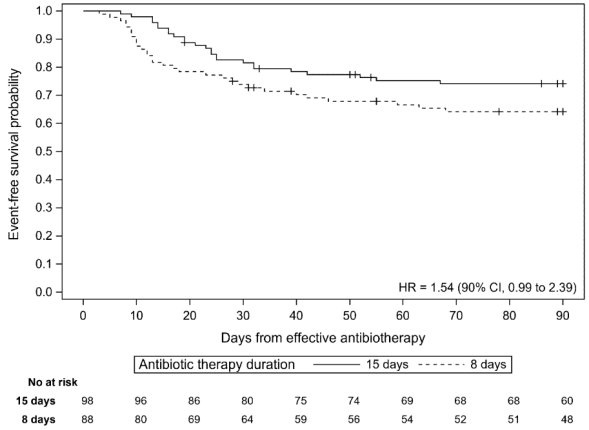

Fig. 2 Event-free survival curves of the survival probability for VAP recurrence or death in ICU (Kaplan–Meier estimates) in the ITT population. Survival probability is for the 90 days since the start of effective antibiotic therapy as a function of the duration of antibiotic therapy

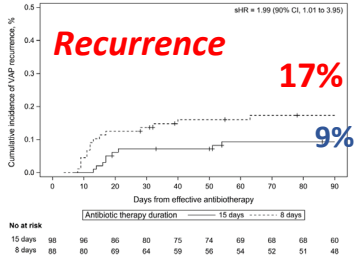
Table 3 Secondary outcomes, according to study group

Outcome or event	15-day group (*N* = 98)	8-day group (*N* = 88)	Difference (95% CI)
Duration of mechanical ventilation, days[a]	25 (15.5–35)	22 (12–41)	−3 (−9 to 5)
Duration of ICU stay, days	34 (23–56)	34 (20–54)	0 (−7 to 6)
Exposure to antibiotics during ICU stay, days	23 (15–34)	18 (11.5–28.5)	−5 (−9 to 0)
Number of extra pulmonary infections during ICU stay[a]	1 (0–2)	1 (0–2)	0 (−1 to 1)
Acquisition of MDR pathogens during ICU stay—no. (%)	24/97 (24.7)	17/84 (20.2)	−4.5% (−16.8 to 8.3%)



The percentage of recurrence of PA-VAP during the ICU stay was 9.2% in the 15-day group versus 17% in the 8-day group.

BUT

Unbalanced time at risk for recurrence!

Take-home message

The optimal duration of treatment for *Pseudomonas aeruginosa* ventilator-associated pneumonia remains unknown. In a prospective randomized trial, we did not demonstrate the non-inferiority of a short duration (8 days) of antibiotic therapy.

Bouglé A, Intensive Care Med. 2022 Jul;48(7):841-849. doi: 10.1007/s00134-022-06690-5.

Individualised, short-course antibiotic treatment versus usual long-course treatment for VAP (REGARD-VAP): a *multicentre, individually randomised, open-label, non-inferiority trial*

Participants were randomized until **fever resolution for 48 h and haemodynamic** stability, to individualised **short-course treatment (≤7 days) or usual care (≥8 days**, with precise durations determined by the primary clinicians).

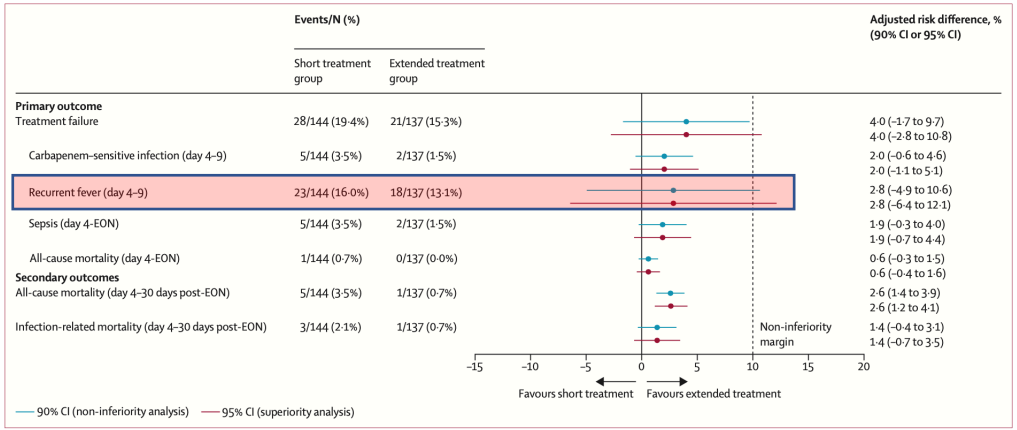
Table 3: Efficacy and safety endpoints

EAT was withdrawn after 72 h or more of apyrexia plus clinical recovery;
(Control group, treatment was withdrawn when the neutrophil count was also 0·5 × 109L)

Short versus extended treatment with a carbapenem in patients with high-risk fever of unknown origin during neutropenia: a non-inferiority, open-label, multicentre, randomised trial

*fixed short treatment **(3 days)** compared with an extended treatment **(9–14 days)***

Nick A de Jonge, Jonne J Sikkens*, Sonja Zweegman, Aart Beeker, Paula Ypma, Alexandra H Herbers, Wies Vasmel, Arne de Kreuk, Juleon L L M Coenen, Birgit Lissenberg-Witte, Mark H H Kramer, Michiel A van Agtmael*, Jeroen J W M Janssen**

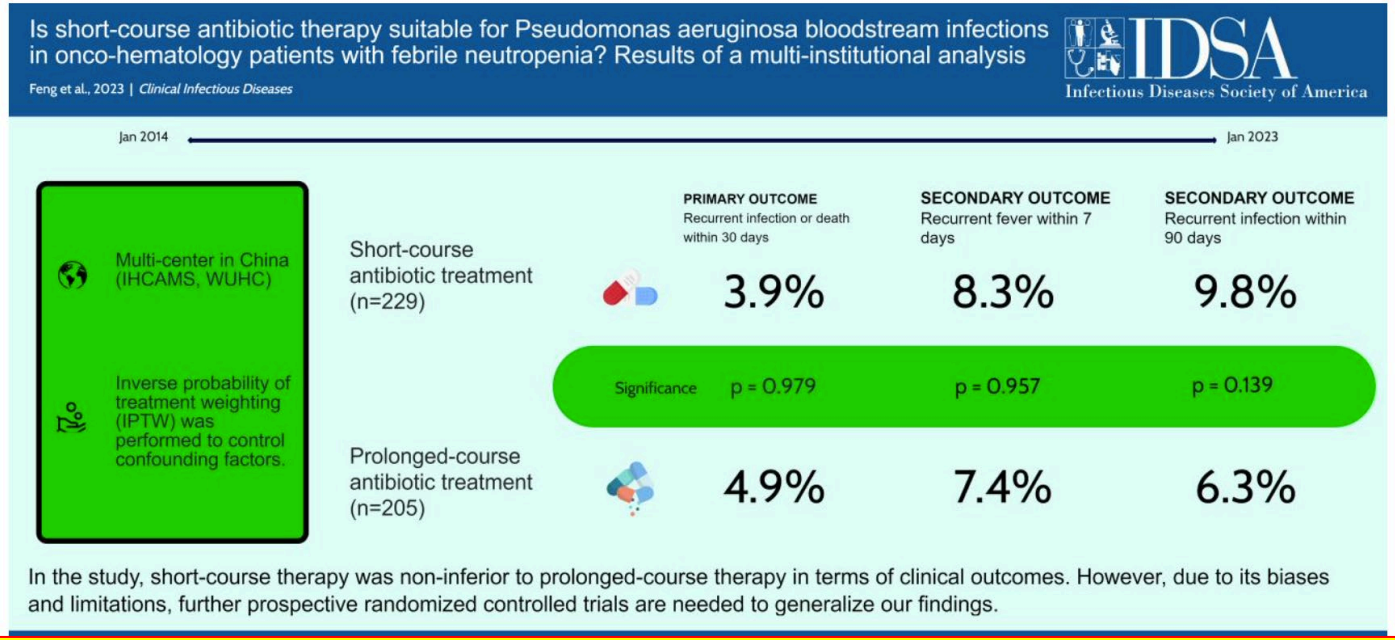


None of the deaths were related to carbapenem-sensitive infections.
Early discontinuation of carbapenem treatment in patients with febrile neutropenia of unknown origin **does not result in increased treatment failure.**
Our study supports short treatment if patients are afebrile after 3 days of carbapenem treatment.

Aguilar-Guisado M. Lancet Haematol. 2017;4(12):e573–83.
Lancet Haematol 2022; 9: e563–72

Is Short-course Antibiotic Therapy Suitable for *Pseudomonas aeruginosa* BSIs in Onco-hematology Patients With Febrile Neutropenia?

Results of a Multi-institutional Analysis



Limitations: Low prevalence of comorbidities due to our populations being predominantly **young** & 50% of cases were **primary BSI.**

- ***Primary factors recurrence and mortality were***: ***MDR bacterial infections, perianal or pulmonary infections***, and persistent or recurrent hematological malignancies, **neutropenia non-recovery**.

Feng X, Clin Infect Dis. 2024 Mar 20;78(3):518-525.

How to implement descalation strategies?

Evidences and Real-life strategies

Modena Antibiotic Stewardship Programme
at hospital level

AIM: Assess whether an Electronic Clinical Decision Support Systems (eCDSS) combined with infectious disease (ID) clinicians progressive feedback can improve antimicrobial stewardship (AMS) indicators for adults admitted to tertiary care hospitals.

ASP GUIDELINES 2007

CORE ELEMENTS
- Formulary restriction with re-authorisation of named anti-infectives
- Prospective audit with intervention and feedback
- Multidisciplinary AMS team
- Guideline development

ADDITIONAL ELEMENTS
- De-escalation of therapy based on culture results
- Dose optimisation
- IV to PO switch
- Education
- Antimicrobial order forms
- Antimicrobial cycling
- Combination antimicrobial therapy
- Information technology to provide decision support and enhanced surveillance
- Antibiograms - at patient and organisation level

Barlam TF, Clin Infect Dis. 15 maggio 2016;62(10):e51–77

MODENA ANTIMICROBIAL STEWARDSHIP

CORE ELEMENTS
- ✓ ✓Advisory services: request on electronic agenda-urgent calls
- ✓ ✓Control of high-cost drug prescriptions within 48 hours of prescription
- ✓ ✓Clinical audits with direct feedback on the 'Adopt-a-Department' field
- ✓ ✓Identification of an AS team
- ✓ ✓Development of empirical therapy guidelines and treatment algorithms for hospital infections

ADDITIONAL ELEMENTS

✓**Computer tool (Database) shared between pharmacists and infectivologists for monitoring antibiotics-antifungals with high ecological and economic impact** (patient identification and delivery of therapies max. for 72 h)

✓Report on consumption of all antibiotics-antifungals by home made management control software (Fac VIEWER) Report on prescriptive appropriateness per therapeutic indication and monitoring adherence to guidelines

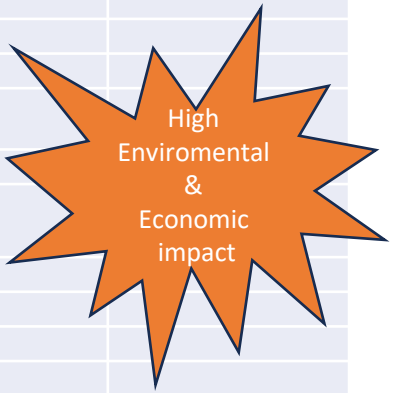
✓*Experimental ecological* models*for identifying prescriptive thresholds for the hospital*

Meschiari's personal data

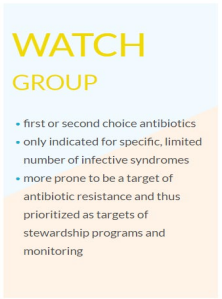
Materials and Methods

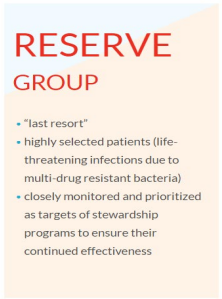
- Prospective observational study conducted **from April 2022 to April 2024** in the 1200-bed tertiary care referral University Hospital of Modena, northern Italy.
- Since April 2022 an **Electronic Clinical Decision Support Systems** (eCDSS), integrating patient-specific data of antimicrobial prescriptions with pharmacy information by an automatic alert, was implemented.

Antibiotics		Antifungals	Others
Ampicillin-sulbactam	Fidaxomicin	Anidulafungin	Bezlotoxumab
Aztreonam	Fosfomycin	Caspofungin	
Cefiderocol	Imipenem	Micafungin	
ceftaroline	Imipenem-relebactam	Isavuconazole	
Ceftazidime-avibactam	Linezolid	Voriconazole	
Ceftobiprole	Meropenem		
Ceftolozane-tazobactam	Meropenem-vaborbactam		
Dalbavancin	Oritavancin		
Daptomycin	Tedizolid		
Ertapenem	Tigecyclin		
Eravacycline			



All these antimicrobial prescriptions must be required through an **informatic motivated request form** at the hospital pharmacy and automatically reported in a shared database between pharmacists and infectious disease specialists involved in AMS implementation





World Health Organization (WHO). AWaRe classification of antibiotics for evaluation and monitoring of use, 2023 https://www.who.int/publications/i/item/WHO-MHP-HPS-EML-2023.04

DATABASE

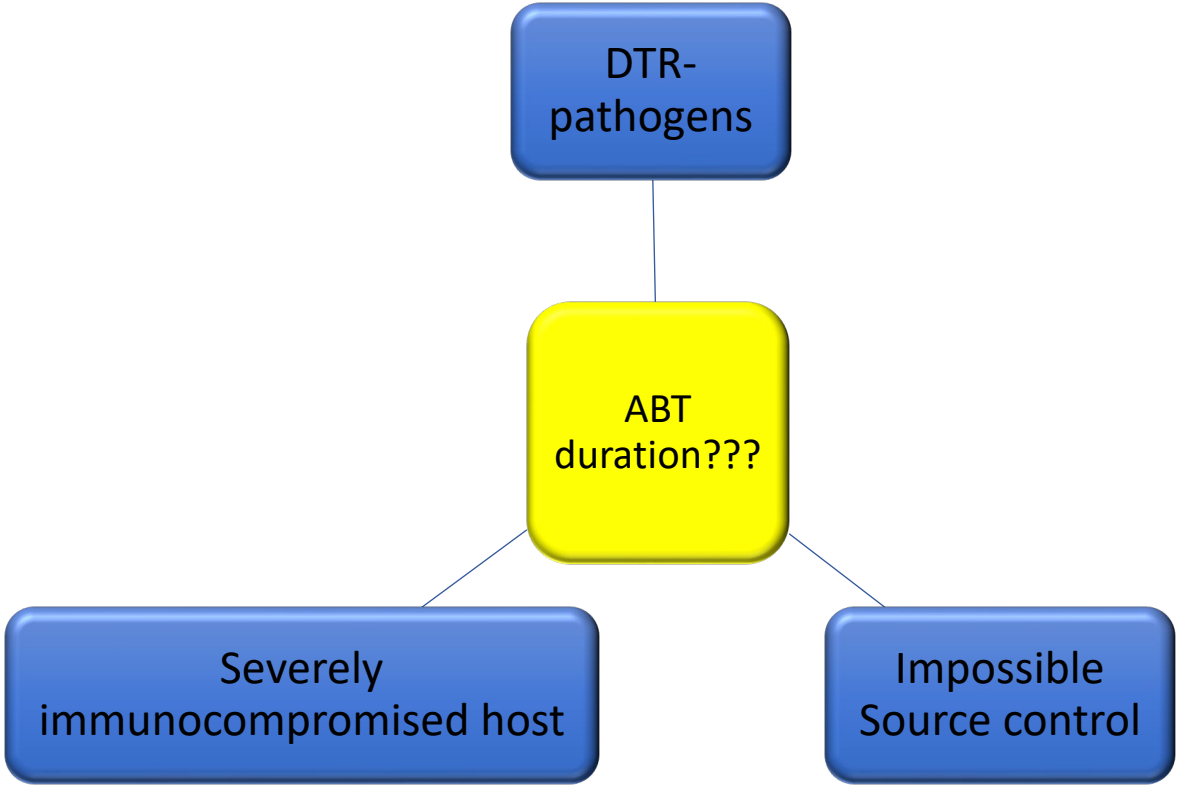
Final considerations

Future perspectives

The real challenge



Short course antibiotics for common infections: *Take-home messages*

- Designing clinical trials to assess **appropriate antibiotic durations** can be challenging
- Recent RCTs have commonly used a **non- inferiority** design to assess clinical outcomes, such as *clinical cure*.
- However, the endpoints for some studies may include ***outcomes*** not irrelevant to patients or clinicians, such a:

✓*microbiological cure*
✓*AMR*
✓*Others Aes (CDIs)*

- Lack of RCTs evaluated duration *per pathogens* more than for site of infection (not specified if BSI y/n)
- Too restrictive ***inclusion/exclusion criteria*** in RCTs (haemodynamic instability, Polymicrobial growth, IDs..)
- Complicated infections is a ***dynamic concept and could be reversed***
- ***In these complicated scenarios, you will to individualize treatment duration basing on clinical response and risk of recurrence***

what do we Know and where do we Go from Here?

PERSPECTIVES

Can the Future of ID Escape the Inertial Dogma of Its Past? The Exemplars of Shorter Is Better and Oral Is the New IV

Kusha Davar,[1] Devin Clark,[1] Robert M. Centor,[2] Fernando Dominguez,[1] Bassam Ghanem,[3] Rachael Lee,[4] Todd C. Lee,[5] Emily G. McDonald,[6] Matthew C. Phillips,[7,8] Parham Sendi,[9] and Brad Spellberg[1]

Table 2. Summary of Randomized Controlled Trials of Oral vs IV-Only Therapy

Diagnosis	No. of RCTs Demonstrating IV > Oral	No. of RCTs Demonstrating Oral ≥ IV	References
Osteomyelitis	0	9 (all equal)	[103–111]
Bacteremia	0	10 (8 equal, 2 superior cure for oral)	[109, 112–120]
Endocarditis	0	3 (2 equal, 1 superior mortality for oral)	[121–123]

Abbreviations: IV, intravenous; RCT, randomized controlled trial.

(1) the patient is clinically and hemodynamically stable;
(2) procedural source control ideally with clearance of bacteremia;
(3) the patient's gut is functioning and likely to absorb oral medications;
(4) a published regimen is available for the target pathogen

With the shared goal of bettering patient care..
"Oral is the new IV" needs to be more than just a motto.
It is time to make that switch, both in our mind-set and in practice..
